diseases. Nucleic acid encoding apoptosis related gene bcl- \mathtt{w} - used to induce or inhibit cell survival, e.g. for treatment of cancer and degenerative

Claim 3; Page 48; 86pp; English.

This sequence encodes a novel human gene, bcl-w, from the bcl-2 gene family, extracted from an adult brain library. This gene promotes cell survival, so its modulation is useful in treatment of cancer or auto-immune diseases, degenerative diseases (e.g. stroke, Alzheimer's disease, myocardial infarct, muscular degeneration, hypoxia, ischaemia, human

Up-regulation of the gene can also be used to modify cell lines cultured in vivo, e.g. to develop new lines, to facilitate isolation of hybridomas and to increase survival of primary explants during genetic modification. It can be used to produce recombinant Bc1-w for therapy, diagnosis, antibody production or screening of potential modulators

The present sequence is described as a derivative of the human bcl-w gene (see AAX25132) and encodes Bcl-w protein (see AAY05532), a pro-survival comember of the Bcl-2 family which is widely expressed and which is cessential for spermatogenesis. The invention relates generally to a comethod of treatment and to an animal model for the identification of comethod of treatment and to an animal model for the identification of complex and genetic sequences useful for inducing or reducing fertility. CC of male animals. Methods are provided for the treatment of infertility. CC or for reducing fertility, by modulating spermatogenesis. An animal model courries a mutation is at least one allele of the human or murine bcl-w carries a mutation is at least one allele of the human or murine bcl-w complex contributes and are substantially infertile, but possess no other complex tubules and are substantially infertile, but possess no other complex contributes as determined by histological examination. They can complex contributes and complex contributes including genetic sequences compable of inducing, enhancing or otherwise facilitating spermatogenesis compable, or which can induce infertility

At least part of one strand (as1) of dsRNA1 is complementary to (I) and at least one end of dsRNA1 has an overhang of 1-4 nucleotides. The method is used to inhibit the expression of a wide range of genes, e.g. oncogenes, cytokine genes etc. in humans, also genes in Plasmodium or in viruses or viroids that are pathogenic for humans, animals or plants. Introducing an overhang into dsRNA greatly increases effectiveness for inhibiting gene expression, both in vivo and in vitro and also increases stability and thus the effective concentration inside the cell. The present sequence is that of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    09-JAN-2001; 2001DE-01000586.

Inhibiting expression of target genes, useful e.g. for treating tumors, by introducing into cells two double-stranded RNAs that are complementary to the target.

Claim 13; Page 30-31; 100pp; German.

The invention relates to inhibiting expression of a target gene in a cell by introducing at least two oligoribonuclectides (dsRNAI and II), both with a double-stranded (ds) structure of at most 49 sequential nucleotide pairs. At least part of one strand (S1, S2) of the ds structures in each of dsRNAI and II are complementary to regions in the target gene. The

The method is particularly used to treat tumours or infections, especially by Plasmodium or viruses/viroids (pathogenic on humans, animals or plants). The method provides more effective inhibition of expression than known methods using a single dsRNA, even at very low concentrations. When dsRNA has at least one unpaired nucleotide at the end, stability (and thus effective concentration in the cell) is improved and efficiency can be increased further by pretreating the cells with interferon. The present sequence is that of a target DNA of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence

This invention describes a novel method for inhibiting expression of a CC target gene by introducing into the cell that contains the target gene at CC least one oligoribonucleotide (dsRNAI) that has a double-stranded (ds) structure of not more than 49 consecutive nucleotides (nt), where at CC least a segment of one strand of the ds structure is complementary with CC the target gene and the cells are treated with interferon before CC introduction of dsRNAI. The method is used to inhibit expression of CC target genes, particularly oncogenes, cytokine genes, Id (not defined) protein genes, developmental or prion genes, or invitues or viroids CC (pathogenic organisms (particularly plasmodia) or in viruses or viroids CC (pathogenic in humans, animals or plants). Treating the cells with CC interferon greatly increases the extent to which dsRNA can inhibit CC expression of the target genes, and the effect is even greater when dsRNA care modified to increase their stability.                                                                                                                                                                                      The invention relates to a method for inhibiting expression of a target gene (ABL91658-ABL91797) in a cell by introducing at least one oligoribonuclectide that has a double-gtranded structure consisting of at most 49 sequential nucleotide pairs, with at least part of one strand complementary with the target gene and has at least one end a single-stranded segment of 1-4 nt. The method provides oligoribonucleotides for antisense inhibition of gene expression useful e.g. for treating tumours but the oligoribonucleotides may also be directed against genes present in pathogens (e.g. Plasmodium or viruses/viroids, pathogenic on humans, animals or plants) or against cytokine, Id, developmental or prion genes. The method provides more effective inhibition of gene expression than use of known oligonucleotides, probably because the unpaired overhang increases stability and thus intracellular concentration
                                                                                                                                                                                                                                                                                                                                                                                       Claim

Novel DNAzyme useful for treating tumors, and for enhancing the sensitivity of malignant or virus infected cells to therapy, concatalytic domain and binding domain contiguous to the catalytic comprises domain.

Disclosure; Page 44-45; 67pp; English

The invention relates to a DNAzyme which specifically cleaves mRNA transcribed from a member of the bol-2 gene family. The DNAzymes compi a catalytic domain, binding domains contiguous with the 5' and 3' end the catalytic domain, and therefore hybridise with, the two regions immediately flanking the purine residue of the cleavage site within the comprise end of the

A pharmaceutical composition comprising a DNAzyme of the invention is useful for treating tumours in a subject, and for enhancing the sensitivity of malignant or virus infected cells infected cells to therapy. The DNAzymes are useful in diagnostics, therapeutics, prophylaxis, research agents and in kits. The DNAzymes are also useful to increasing the susceptibility of tumour cells to anti-tumour therapies such as chemotherapy and radiation therapy. This polynucleotide sequence represents a human bcl-2 gene of the invention

The present sequence is the human bcl-w gene encoding Bcl-w protein (see CC AAY05530), a pro-survival member of the Bcl-2 family which is widely CC expressed and which is essential for spermatogenesis. The invention CC relates generally to a method of treatment and to an animal model for the CC identification of molecules and genetic sequences useful for inducing or CC reducing ferrility, of male animals. Methods are provided for the CC treatment of infertility, or for reducing ferrility, by modulating CC spermatogenesis. An animal model carries a mutation is at least one CC allele of the human or murine bcl-w gene or in a gene associated with bcl CC substantially infertile, but possess no other major abnormalities as CC determined by histological examination. They can be used to screen for CC therapeutic molecules including genetic sequences capable of inducing, CC canancing or otherwise facilitating spermatogenesis in animals, or which CC can induce infertility
                                                                                                                                                                                                                                                                                                             An animal

                                                                                                                                                                                                                                                                                                                                                                family, components in the cell death pathway. The bcl-2 family, components in the cell death pathway. The bcl-2 family have both apoptotic activity and the apoptosis blocking activity, bcl-y falls in the apoptosis activity category. The recombinant protein may be used to prevent uncontrolled cell growth, either by its direct administration to recombinant genetic constructs to increase its expression in vivo. Also, antisense constructs can be used in disorders where prevention of cell death is desired
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acids encoding B-cell lymphoma-y protein - useful for producing recombinant protein for use in treating uncontrolled cell growth e.g.

Novel bcl-y homologues of the rat and human bcl-2 protein - useful modulating programmed cell death.

for

```
The present sequence encodes human bcl-y protein (Hbcl-y). The constitution also describes rat bcl-y protein (Rbcl-y). Rbcl-y and Hbcl-cy are homologues of the bcl-2 protein thought to be involved in corporation and encodes and necrosis. Rbcl-y and Hbcl-y proteins may be used to treat conditions associated with a disruption of complete the cell death (apoptosis and necrosis). Rbcl-y and Hbcl-y could be used to treat conditions associated with a disruption of complete the cell death pathway. If they act as cell death inhibitors, they may be used in therapies to treat subjects suffering from: strokes, head trauma, considered the cell death and muscular degenerative diseases. Complete the spinal cord injuries and amyotrophic lateral sclerosis could death, aging, spinal cord injuries and amyotrophic lateral sclerosis conditions where cells under go premature cell death as a result of triggers which may or may not be apparent. They may also be used in this complete the conditions associated with prolonged cell lifes which remain viable in culture for an extended complete the conditions associated with prolonged cell conditions associated with prolonged cell conditions associated with prolonged cell cand auto/hyperimmune diseases. They may also be used to cause cell death in, and hence control, parasites
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                 The present invention describes a method for determining whether a compound induces a toxic effect on a tissue or cell. The method comprises preparing a gene expression profile of a tissue or cell sample exposed to the compound, and comparing the gene expression profile to a database comprising data or information on the Tox mean and non-Tox mean value. The method is useful for predicting or identifying at least one toxic effect, particularly hepatotoxicity, of a test or unknown compound. The genes listed in the specification are useful as diagnostic or toxicity markers for the prediction or identification of the physiological state of tissue or cell sample that has been exposed to a compound, or to identify or predict the toxic effects of a compound or an agent. These may also be used as markers for monitoring toxicity progression or for the predict the toxic effects of a compound or an agent. These
                                                                                                                                                                                                                                                                                                                                                                            Mendrick
Elashoff
                                                                                                                                                                                                                                                                        Determining if a compound induces a toxic effect on a tissue or cell, for identifying hepatotoxic compounds, comprises comparing a gene expression profile of a tissue or cell sample to a database of Tox mean and non-Tox mean values.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Rattus norvegicus

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The mammalian bol-y genes encode a protein that is a member of the bol-2 family, components in the cell death pathway. The bol-2 family have both apoptotic activity and the apoptosis blocking activity. Bol-y falls in the apoptosis activity category. The recombinant protein may be used to prevent uncontrolled cell growth, either by its direct administration to recombinant genetic constructs to increase its expression in vivo. Also, antisense constructs can be used in disorders where prevention of cell

                                                                                                                                                                                                                         5
                                                                                                                                                                                                                                                                                                                                                      CC specification also describes human bcl-y protein (Rbcl-y). The specification also describes human bcl-y protein (Hbcl-y). Rbcl-y and CC specification also describes human bcl-y protein (Hbcl-y). Rbcl-y and Hbcl-y are homologues of the bcl-2 protein thought to be involved in CC programmed cell death (apoptosis and necrosis). Rbcl-y and Hbcl-y CC proteins may be used to treat conditions associated with a disruption of CC the cell death pathway. If they act as cell death inhibitors, they may be used in therapies to treat subjects suffering from: strokes, head trauma, Alzheimer's Disease, neural and muscular degenerative diseases CC (especially multiple sclerosis), myocardial infarction, vitally induced CC cell death, aging, spinal cord injuries and amyotrophic lateral sclerosis CC triggers which may or may not be apparent. They may also be used in this CC way to develup cell lines which remain viable in culture for an extended CC period. In contrast, if they act as cell death stimulators, Rbcl-y and CC the span such as cancer (especially kaposi's sarcoma and lung cancer) CC and auto/hyperimmune diseases. They may also be used to cause cell death coi, and hence control, parasites

An animal model exhibiting reduced protein associated with Bcl-w.

levels

e E መ Bcl-w

protein and/or

(see

34;

52pp;

The present sequence is the mouse bcl-w gene encoding Bcl-w protein (see AAY05531), a pro-survival member of the Bcl-2 family which is widely expressed and which is essential for spermatogenesis. The invention relates generally to a method of treatment and to an animal model for the identification of molecules and genetic sequences useful for inducing or reducing fertility of male animals. Methods are provided for the treatment of infertility, or for reducing fertility, by modulating spermatogenesis. An animal model carries a mutation is at least one allele of the human or murine bcl-w gene or in a gene associated with bcl substantially infertile, but possess no other major abnormalities as determined by histological examination. They can be used to screen for therapeutic molecules including genetic sequences capable of inducing,

This sequence encodes a novel gene, bcl-w, from the mouse bcl-2 gene family. This gene promotes cell survival, so its modulation is useful in treatment of cancer or auto-immune diseases, degenerative diseases (e.g. stroke, Alzheimer's disease, myocardial infarct, muscular degeneration, hypoxia, ischaemia, human immunodeficiency virus infection or in cell transplants. Up-regulation of the gene can also be used to modify cell lines cultured in vivo, e.g. to develop new lines, to facilitate isolation of hybridomas and to increase survival of primary explants during genetic modification. It can be used to produce recombinant Bcl-w modulators, diagnosis, antibody production or screening of potential
